1 Datatypes

ZUMA is strongly typed.

Following datatypes can be created using literals:

1.1 Boolean

Boolean has one of values `true` or `false`.

1.2 Number

Number is a single precision floating point, i.e. `f32`: `1.5464`.

1.3 Point

Point is declared using two numbers inside square brackets like `[4.45,6.06]`.

1.4 Color

Color can be declared using sharp followed by hexadecimal value: `#ff00a1`. Additionally few basic colors can be declared by their name: `black`, `white`, `red`, `green`, `blue` or `yellow`.

1.5 Text

2 Coordinate system

Origin point is left upper corner. x is vertical axis, y is horizontal axis.

Therefore $[0,500]$ describes upper right corner, while $[500,0]$ describes lower left corner.

3 Language constructs

3.1 Expressions

Expressions are delimited using semicolon.

```
line start = [0,10] end = [25,50] color = #ff00a1;
```

Expressions are following constructs:

- constant declaration
- function call
- scope

3.2 Comments

Single line:

```
// this is comment
```

Part-line / multiline:

```
/* multiline comment */
```

Comments can be nested:

```
/* /* */ */
```

```
/* */ */
```

```
/* /* */
```

Anything inside comments shouldn't break compilation.

3.3 Scopes

Scope is delimited by { and }. There is list of expressions between braces. Scope is an expression.

4 Architecture

4.1 Parser

4.2 Abstract Syntax Tree

4.3 Evaluation

remove comments, eval variables, ifs and for loops

4.4 ZUMA IR

4.5 Translation

ZUMA IR to SVG model

4.6 Generate SVG
